Nitric Oxide Synthase (NOS) Detection Reagent

Key Benefits

- Cell permeable
- No wash homogenous assay
- Adaptable to High throughput assay platforms
- Real time detection of NOS activity.

Assay Principle
Diaminofluorescein –2 Diacetate (DAF-2DA) is a non-fluorescent cell permeable reagent that can measure free Nitric Oxide (NO) and nitric oxide synthase (NOS) activity in living cells under physiological conditions. Once inside the cell the diacetate groups on the DAF-2DA reagent are hydrolyze by cytosolic esterases thus releasing DAF-2 and sequestering the reagent inside the cell. Production of nitric oxide converts the non-fluorescent dye, DAF-2, to its fluorescent triazole derivative, DAF-2T.
DAF-2T can be observed by: excitation 488nm and measuring emission at 515nm.

Reactivity
DAF-2DA can be used to detect NOS activity in cell culture or tissue sections. This reagent is not species specific and can also be used to detect NOS activity in plant cells.

Fig 1. DAF-2DA, the non-fluorescent probe, enters the cells where cytosolic esterases hydrolysis the diacetate groups, releasing the non-fluorescent DAF-2 dye. DAF-2 then reacts with NO and O2 to produce DAF-2T, its triazole fluorescent derivative.

Product Specifications

Formula: C_{24}H_{18}N_{2}O_{7}
MW: 446.4
Appearance: Liquid

Formulation: DAF-2DA is dissolved in DMSO at approx 5mM.
Manufactured: by Daiichi Pure Chemicals Co. Ltd. Japan
*Not For Sale in Japan

Product Catalog Information

1. NOS 200-1 ......................... 1 vial .125 mg per vial at 2.22 mg/mL.
2. NOS 200-2 ......................... 1 vial .250 mg per vial at 2.22 mg/mL

Dilute 1:250 to 1:500 for a 1X working solution.

References.
