

Nucleic acid biotinylation / study AMCH-Biotin

Specifications

Catalog number: UPR0756A, 10mg
Name: **AMCH-Biotin**
Aldehyde reactive biotin ARP

Formula : N-(aminoxyacetyl)-N'-(D-biotinoyl) hydrazine, trifluoroacetic acid salt
 $C_{14}H_{22}F_3N_5O_6S$; **MW= 445.41**
Solubility: 10 mg/ml water, or soluble in DMSO
Appearance: white powder
Packaging : 10 mg
Storage : -20°C
Shipping : Room Temperature

General information

- Abasic sites in DNA, generated spontaneously or caused by free radicals, ionizing radiation or mutagens like MMS (methyl methanesulfonate), are one of the most common lesions in DNA and are thought to be important intermediates in mutagenesis.
- Uptima AmcH-Biotin, a biotinylated hydroxylamine, reacts with the exposed aldehyde group at abasic sites (AP sites, depurine/depyrimidine sites) of DNA.
- AmcH-Biotin tags at the AP sites of DNA for detection purposes: the biotin can then be detected by peroxidase-labeled avidin and oxidative chromogenic dyes such as OPD or TMB (#UP66478), fluorescent labels or any other ([Sun 2001](#)). A quick and sensitive microplate assay for abasic sites can be performed ([Kow 2000](#)). It has been reported that less than one abasic site in 1x10⁴ nucleotides of DNA can be detected. Conjugated to PCR technics, the current limit of detection os of one base aldehyde substitution in 7 Mb of DNA and increases the limit for unknown mutation scanning by two to three orders of magnitude ([Subratra 2000](#)).
- Biotinylated DNA can also be purified with monomeric avidin supports (UP29337) ([Sun 2001](#)).
- AMCH-Biotin is permeant to cell membranes, permitting detection of abasic sites in living cells ([Atamna 2000](#)).

Use

Considering the new and various applications, Uptima recommends to refer to the litterature for information of uses.
